

Recent Projects

Project 1

A tank battery had an accidental spill during the summer of causing produced water to flow off site

the 88 days between the initial remediation and the sample date of 2/25. A second sample, taken ~~0/25~~, was collected from the same area as the initial sample. Those results are as follows: 1)
Total

Project 2

This site was remediated on 12/22/16 and contained approximately 2,000 cubic yards of salt contaminated soil. The site received, approximately, 3" of rainfall during the 91 days of treatment. Soil samples were collected on 1/10/17, and analyzed by Environmental Testing, Inc. (ETI) for Total Salts (TSS), Conductivity (EC), and Chlorides (C). The initial sample with the highest level of contamination was as follows: 1) Total Soluble Salts 28,300 ppm 2) Conductivity 44,200 umhos/cm and 3) Chlorides 15,000 mg/kg. A second soil sample was collected from the same area as the initial soil sample on 2/25. Those test results are as follows: 1) Total Soluble Salts 1,960 ppm, 2) Conductivity 651 umhos/cm and 3) Chlorides 651 mg/kg. These reductions equate to a reduction of 93% for TSS, a 93% reduction for EC, and a 96% reduction for Chlorides. These reductions will continue to improve. These reductions mirror Project 1 because the well drilled in Project 2 was to the same formation as Project 1. So it is not surprising that the reductions were similar. The product cost will vary with the level of contamination. The project included a combination of a salt remediation product and organic
